We have identified a calculational error in the prediction contained in Eq. (8) in our recent Letter [1]. The correct equation reads

$$m_2 \sim (\beta^4 t)^\alpha, \quad \alpha = \frac{1}{1 + d\sigma}. \quad (1)$$

The exponent $\alpha$ is therefore bounded from above by $\alpha_{\text{max}} = 1$, which is obtained for $\sigma \to 0$. All results of the Letter [1], as well as all other predictions, are untouched.
